## Basic Principles of Electricity

## Course Syllabus

GIOhGIO hIZZONI

FOURTH EDIIOK
PRINCIPLES AND APPLICATIONS OF

## Chapters to be Covered

- Basic Principles of Electricity,
- Circuit Analysis,
- AC Circuits,
- AC Power,
- Phasors,
- Three Phase Systems,
- Transformers,
- Magnetic Circuits,
- Electrical Safety

## Basic Principles of Electricity

## Basic Principles of the Course

## Examinations

## Two midterm examinations and a final exam

Midterm Exam 1 (Three questions, equal credits, 90 min ) Midterm Exam 2 (Three questions, equal credits, 90 min ) Final Exam (Four questions, equal credits, 120 min ) Attendance

## Basic Principles of Electricity

## Homework

## No homeworks will be assigned

You are advise to examine;

- the homeworks in the book,
- examination questions that will be distributed

## Basic Principles of Electricity

## Basic Principles of the Course

## Examinations

- Midterm examinations will cover all the material taught until the examination date,
- Final Examination will cover the overall course material,
- Announced exam schedule can neither be changed nor discussed after it has been settled,
- Duration of the examination will never be extended,
- Questions will never be allowed during the examination

## Basic Principles of Electricity

## Basic Principles of the Course

## Make-up Examinations

Will be given only to those students with valid documented excuse, Requests for make-up exam that does not include a valid documented excuse will be rejected,

- A single make-up exam will be given to all students with legitimate rights for the exam,
- Exam will be carried out in an officially settled date and hour, Exam will not be repeated, i.e. Make-up of make-up will not be performed,
Students will be responsible for answering the questions only from the parts covered in the exam that they have missed

## Basic Principles of Electricity

## Exam Questions and Solutions

- A file including all exam questions and solutions is available,
- A file including the questions and solutions of all the previous examinations will be submitted to a student who is elected by the class for photocopying and distributing this file to the class,
- This student will be responsible for the toll collection and distribution activity

In case that there is no valunteer for the job, the task will be cancelled !

## Basic Principles of Electricity

## Yahoo Group for the Course

## httpl/groups-yahoo-com/group/ee209/

Yahoo Group for the course is;
httpA/groups-yahoo-com/group/se209/

This group is intended to be the main communication medium for information exchange and storage for the course
Enrollment to this group is compulsory ---
All students are obliged to subscribe to this group by using the procedure described in the next page

## Basic Principles of Electricity

## E-mail Group

## Enrollment

To subscribe from the group, send an email to: ee209-subscribe@yahoogroups.com
To unsubscribe from the group, send an email to: ee209-unsubscribe@yahoogroups.com

## Basic Principles of Electricity

## E-mail Group

## Nicknames (User Gcodes)

## Nicknames

Please choose nicknames that reflect your personal identity, i.e. your surname and/or name and/or you name and surname augmented.

Please do NOT choose improper or annoying nicknames, such as; "Arizona Tigers", "diabolic, "best friend", "miserable(68)" etc. that does not reflect your personal identity

## Basic Principles of Electricity

## E-mail Group

## Communication

All questions, suggestions, complaints, demands, requests and other communication concerning the course should be directed to the e-mail communication address of the group: ee209@yahoogroups.com

The Course Instructor keeps the right of not answering some or all of the questions, suggestions, complaints, demands, requests forwarded in this mail group, in case that it is not necessary, or not relevant, or not possible

## Basic Principles of Electricity

## E-mail Group

## Rules of Communication

## In your e-mails;

- Be polite,
- Start your letter with; "Dear Group Members" or "Dear Friends" and end with; "With best regards"
- Do not use disturbing abbreviatons, such as "slm" for "selam",
- Do not discuss your own personal, social or academic problems,
- Do not be aggressive to the Group members and to Course Instructor,
- Do not discuss subjects not relevant to the course, (such as last match of Fenerbahçe)
People who violate the above rules will be deleted from the group

## Basic Principles of Electricity

## E-mail Group

## Group Moderators

## Course Instructor is the Main Moderator of the e-mail Group.

## Assistant Moderator

An assistant moderator who is familiar with the management of yahoogroups activities, will be elected and appointed for managing the group from valunteer candidates in the class during the first hour. Moderators have identical authorities in group management in all respects

## Basic Principles of Electricity

## Problems

## Complaints and Expressions

Complaints and expressions concerning your;

- personal
- Social,
- Academic
problems will never be listened, nor be appreciated nor be interested.
- Your personal, social and academic problems will never be an influencing factor in grading,
- Your personal, social and academic problems will not be taken into account at all

This course is NOT a proper platform for expressing your own problems, negative or positive human feelings, such as, crying, complaining, hating, admiring, or any other physiologic, psychological expressions

## Basic Principles of Electricity

## E-mail Group

## Office Hours

## Unfortunately, there will not be any chance for office hour

- Please do not refer my office for any reason,
- and do not blame for that.

## Basic Principles of Electricity

## E-mail Group

## Telephone Galls

## My GSM No: 05323847865

Telephone calls for concerning your personal, social and academic problems will neither be listened, nor be appreciated nor be interested

## Water Current

## Birecik Dam (672 MW)

## ( <br> Basic Principles of Electricity

## Example: Electrical Current

A cylindrical conductor is 1 m long and 2 mm in diameter and contains $10^{29}$ free carriers per cubic meter.

1. Find the total charge of the carriers in this wire.
2. If the wire is used in a circuit, find the current flowing in the wire if the average velocity of the carriers is $19.9 \times 10^{-6} \mathrm{~m} / \mathrm{s}$.

2 mm diameter

## Basic Principles of Electricity

## Example: Electrical Current

2 mm diameter

## Solution:

1. In order to compute the total charge contributed by the electrons, we first need to compute the volume of the conductor.

Volume $=$ Length $\times$ Cross-sectional area

$$
=\pi r^{2} L=\pi\left(\frac{2 \times 10^{-3}}{2}\right)^{2}(1)
$$

Next we compute the charge by determining the total number of charge carriers in the conductor as follows:

$$
\begin{aligned}
\text { Charge } & =\text { Volume } \times \frac{\text { Charge }}{\text { Unit volume }} \\
Q & =\pi\left(\frac{2 \times 10^{-3}}{2}\right)^{2}(1)\left(-1.602 \times 10^{-19} \mathrm{C}\right)\left(10^{29} \frac{\text { carriers }}{\mathrm{m}^{3}}\right) \\
& =-50.33 \times 10^{3} \mathrm{C}
\end{aligned}
$$

## Basic Principles of Electricity

## Electrical Current

2. If the carriers move with an average velocity of $19.9 \times 10^{-6} \mathrm{~m} / \mathrm{s}$, the magnitude of the total current flow in the wire can be computed by considering that current is the flow of charge per unit time:

$$
\begin{aligned}
\text { Current } & =\text { Charge density per unit length }(\mathrm{C} / \mathrm{m}) \times \text { Carrier velocity }(\mathrm{m} / \mathrm{s}) \\
& =\frac{50.33 \times 10^{3}}{1} \times 19.9 \times 10^{-6} \\
& =1 \mathrm{~A}
\end{aligned}
$$

2 mm diameter

## Basic Principles of Electricity

## Mechanical Force

## Definition

$F=m \times a$
Force needed to accelarate 1 kg of mass to 1 meter / $\mathrm{sec}^{2}$ is defined as 1 Newton

1 Newton = 1 kg x 1 meter / sec²
1000 Newton = $1000 \mathrm{~kg} \times 1$ meter / sec ${ }^{2}$
Accelaration $=1 \mathrm{~m} / \mathrm{sec}^{2}$

## ( <br> Basic Principles of Electricity

## Mechanical Energy

## Definition

## 1 Joule = 1 Newton $\times 1$ Meter

## 1 Joule is the energy needed to move a mass 1 meter by using 1 Newton force

## Basic Principles of Electricity

## Power

## Definition

Power is the work done within a certain unit of time, i.e. one second or one hour
Power = Energy / Duration
= 1 Joule $/$ sec

Please note that force (and hence power) of the weak horse shown below is half of the first, but the work done (energy spent) is the same, i.e.
Energy $=2$ seconds x 0.5 Newton $x$ 1 meter

Energy = 1 Joule, Power = 1 Joule / sec.

Energy = 1 Joule, Power = 1 Joule / 2 sec.

## Basic Principles of Electricity

## Mechanical Energy vs Electrical Energy

## Fquivalance

The same amount of energy may be spent out by using electricity
Mechanical Energy = Electrical Energy
Mechanical Work = Electrical Work

Mechanical Energy (Work) = 1 Joule

Current (I)

Electrical Energy (Work) = 1 Joule

## Basic Principles of Electricity

## Electrical Power

## Definition

Similar to mechanical power, electrical power is the work done within a certain unit of time, i.e. one second or one hour Elecrical Power = Electrical Energy / Duration
= 1 Joule / sec

Current (I)

Electrical Power = 1 Joule $/$ sec.

## Basic Principles of Electricity

## Equivalence of Mechanical and Electrical Powers

## Equivalance

## Mechanical Power = Electrical Power

Mechanical Power = 1 Joule $/$ sec.
(1 sec)

Current (I)

Electrical Power = 1 Joule $/$ sec.

## Basic Principles of Electricity

## Electrical Power

## Definition

1 Joule / second = 1 Watt (1 Joule energy is spent within 1 second)

1 Joule = 1 Watt x second
1 Horse Power = 746 Watts
$=0.746 \mathrm{kWatt}$

1 Joule / sec = 1 Watt

Current (I)

Electrical Power = 1 Joule / sec. = 1 Watt

## Basic Principles of Electricity

## Electrical Power

## Definition

## Power = Voltage x Current

$$
\begin{array}{cccc}
P & =V & x & I \\
(\text { Watt }) & =(\text { Volt }) & \times(\text { Amp })
\end{array}
$$

Current (Amp)

## Basic Principles of Electricity

## Definition

$$
\begin{gathered}
\text { Power }=\text { Voltage } \times \text { Current } \\
\text { or } \\
P=V \times I
\end{gathered}
$$

Voltage = Power / Current

$$
\begin{gathered}
\text { or } \\
V=P / I
\end{gathered}
$$

Current

## Basic Principles of Electricity

## Voltage

## Definition

## Power = Voltage x Current

 orVoltage = Power / Current

$$
\begin{gathered}
\text { or } \\
V=P / I
\end{gathered}
$$

## 1 Volt = 1 Watt / 1 Amp

## Basic Principles of Electricity

## Electrical Energy

## Definition

Energy = Power x Time (Watt-sec) (Watt) (second)

Current (I)

DC Voltage (V)

Energy = Power x Time

## Basic Principles of Electricity

## Unit of Electrical Energy

## Definition

1 KiloWatt = 1000 Watts
1 Hour = 3600 seconds

Energy = Power x Time (Watt-sec) (Watt) (second)
Energy = Power x Time (KiloWatt-hour) (KiloWatt) (hour)

x 1000

1 KiloWatt - hour $=1000 \times 3600$ Watt $\times$ seconds $=3600000$ Joules

Current (I)

Energy = Power x Time

## Basic Principles of Electricity

## Electrical Energy

## Example

Calculate the monthly payment for the energy consumed by the lamp shown on the RHS
Source voltage is 220 Volt
Current drawn by the lamp is 5 Amp
Price of electrical energy is 12 Cents / kWh

$$
\begin{aligned}
\text { Power } & =\text { Voltage } \times \text { Current } \\
P & =V \times I \\
P & =220 \times 5=1100 \text { Watts } \\
\text { Energy } & =P \times \Delta t \\
& =1100 \text { Watts } \times(24 \text { hours /day } \times 30 \text { days/month }) \\
& =792000 \text { Watt hours }=790.2 \mathrm{kWh}
\end{aligned}
$$

Monthly payment $=790.2 \times 12$ Cents $/$ month

$$
\text { = 90.504 USD = } 122.1 \text { YTL / month }
$$

## Basic Principles of Electricity

## Alternative Definition of Voltage

1 Volt

$$
\begin{aligned}
& =1 \text { Watt } / 1 \text { Amp } \\
& =(1 \text { Joule } / \mathrm{sec}) / 1 \text { Amp } \\
& =1 \text { Joule } /(1 \text { Amp x sec }) \\
& =1 \text { Joule } / 1 \text { Coulomb (") }
\end{aligned}
$$

() Remember that $1 \mathrm{Amp}=1$ Coulomb $/ 1 \mathrm{sec}$

1 Volt is the voltage needed;

- to move 1 Coulomb of electrical charge,
- to spend 1 Joule of energy for this movement in a conductor

## Basic Principles of Electricity

## Alternative Definition of Voltage

## 1 Volt = 1 Joule $/ 1$ Coulomb

Please note that time parameter does not appear in the above equation, implying that it is arbitrary
Case-1
Let $\mathrm{t}=1 \mathrm{sec}$
Then, $\mathrm{I}=1$ Coulomb $/ 1 \mathrm{sec}=1 \mathrm{Amp}$
$P=V \times I=1$ Volt $\times 1$ Amp $=1$ Watt
Energy = P x t = ( 1 Joule $/ \mathrm{sec}) \mathrm{x}$ sec = 1 Joule
Case-2
Let now $\mathrm{t}=2 \mathrm{sec}$
Then, $I=1$ Coulomb $/ 2 \mathrm{sec}=0.5 \mathrm{Amp}$
P = V x I = 1 Volt x 0.5 Amp $=0.5$ Watt
= Energy $/ 2=0.5$ Joule / sec
Energy $=$ P x t = $0.5 \times 2=1$ Joule again

## ( <br> Basic Principles of Electricity

## Resistance

## Definition

## Basic Principles of Electricity

## Color Codes for Resistances

## Rule

## Basic Principles of Electricity

## Insulator

## Insulator

Insulator is a material with almost infinite resistance

Insulators are used to support HV lines and conductors

In practice, all materials have resistances. Hence, they conduct a certain amount of current when a voltage is applied to the terminals.
Insulator are materials that conduct only a very small amount of current, even when an extremely high voltage is applied to the terminals.

## ( <br> Basic Principles of Electricity

## Power dissipation in a Resistance

$$
\begin{array}{cccc}
V & =\boldsymbol{R} & x & I \\
(\text { Volt }) & =(\text { Ohm }) & (\text { Amp })
\end{array}
$$

On the other hand, it was shown in this lecture that;

Power = Voltage x Current

$$
\begin{gathered}
o r \\
P=V_{x} I
\end{gathered}
$$

Hence, power dissipation in resistance $R$ is

$$
\begin{aligned}
\text { Power } & =R \times I_{x} I \\
& =R_{x} I^{2} \quad \text { Watt }
\end{aligned}
$$

## ( <br> Basic Principles of Electricity

## Series Connected Resistances

## Equivalent Resistance Formula

$$
\begin{aligned}
& R_{1}=\rho l_{1} / A_{1} \\
& R_{2}=\rho l_{2} / A_{2} \\
& \text { Let } A_{1}=A_{2}
\end{aligned}
$$

Hence;

$$
l_{\text {total }}=l_{1}+l_{2}
$$

$$
\begin{aligned}
R_{\text {total }} & =\rho l_{\text {total }} / A \\
& =\rho\left(l_{1}+l_{2}\right) / A \\
& =\rho l_{1} / A+\rho l_{2} / A \\
& =R_{1}+R_{2}
\end{aligned}
$$

## ( <br> Basic Principles of Electricity

## Series Connected Resistances

## Equivalent Resistance Formula

$$
R_{\text {total }}=R_{1}+R_{2}
$$

Series connected resistances are added

$$
\begin{array}{ccc}
R_{1} \quad R_{2} & R_{k} \\

$$
\underset{(\text { Volt })}{V}=\underset{(\text { Volt })}{V}+\ldots+\underset{\text { (Volt })}{V_{1}}+\underset{n}{V_{n-1}}
$$

$$
\begin{aligned}
V= & \sum_{i=1}^{i=n-1} V_{i} \\
V_{n}= & \sum_{i=1}^{i=n-1} V_{i}=0 \\
& \sum_{i=n}^{i=n} V_{i}=0
\end{aligned}
$$

## Basic Principles of Electricity

## Kirchoff's Voltage Law (KVL)

## Statement

The above result may be expressed as;
Sum of voltages in a closed loop is zero
or

$$
\sum_{i=1}^{i=n} V_{i}=0
$$

## Kirchoff's Second Law or

## Kirchoff's Voltage Law

## Basic Principles of Electricity

## Kirchoff's Voltage Law (KVL)

## Gxample

$$
\sum_{i=1}^{i=n} V_{i}=0
$$

$V_{s}=220$ Volts
$V_{s}-V_{1}-V_{2}=0$
$220-100-120=0$

Current I (Amp)

## ( <br> Basic Principles of Electricity

## Kirchoff's Voltage Law (KVL)

## Simple Rules

Head (pinpoint) of the arrow is negative, Tail of the arrow is positive
This current is assigned such a direction that it always enters from the ' + ' side of the resistance

## ( <br> Basic Principles of Electricity

## A Simple Rule for applying Kirchoff's Voltage Law (KVL)

## A Simple Rule

- Choose a ground node,
- Assume that current I flows clockwise,
- Starting from the ground node, assign " + " and "." signs to those passive elements (i.e. those elements other than source) in such a direction that the current enters to " + " side and the leaves from the "-" side,
- Assign " + " sign to the that side of the source from which current is leaving

## ( <br> Basic Principles of Electricity

## A Simple Rule for applying Kirchoff's Voltage Law (KVL)

## A Simple Rule

- Then write down the voltages on each element by using Ohm Law on a path in a clockwise direction,
- Assign "+" sign to those voltage terms in the equation that you pass from "." to "+",
- Assign "-" sign to those voltage terms in the equation that you pass from "+" to "-",
- Stop and equate it to zero when you come again to the ground node that you have started
Example;

$$
+V_{s}-V_{1}-V_{2}=0 \rightarrow V_{s}=V_{1}+V_{2}
$$

## Basic Principles of Electricity

## Voltage Sources

## Definition

Voltage source is an element which creates a voltage difference at its terminals
$+\quad V=24$ Volts

## A simple Rule:

Current is assigned such a direction that it always leaves the ' + ' side of the voltage or current source.

## Basic Principles of Electricity

## Ideal Voltage Source

## Definition

An ideal voltage source is the one that the terminal voltage does not change with the current drawn
An ideal voltage source has zero internal resistance

## Basic Principles of Electricity

## Non-Ideal (Real) Voltage Sources

## Definition

A voltage source always has an internal resistance R connected in series with the source

Writing down KVL for the above cct;

$$
V_{S}-\Delta V-V_{T}=0
$$

or

$$
V_{T}=V_{s}-\Delta V
$$

where,

$$
\Delta V=R \times I
$$

is called "internal voltage drop"
Terminal voltage $V_{T}$ is reduced by $\Delta V$

## Basic Principles of Electricity

## Non-Ideal (Real) Voltage Sources

## Definition

Writing down KVL for the above cct;

$$
\begin{aligned}
V_{T} & =V_{s}-\Delta V \\
& =V s-R x I
\end{aligned}
$$

## Question

## Current Controlled Voltage Source

Solve the circuit on the RHS for current $\mathrm{I}_{\mathrm{x}}$

## Solution

Write down KVL;
$V_{s}-10-2 I_{x}=0$
$10 I_{x}-10-2 I_{x}=0$
$8 I_{x}=10 \rightarrow I_{x}=10 / 8=1.25 \mathrm{Amp}$

## Basic Principles of Electricity

## Measuring Devices - Ammeter

An ammeter is a measuring instrument used to measure the flow of electric current in a circuit. Electric currents are measured in amperes, hence the name The word "ammeter" is commonly misspelled or mispronounced as "ampmeter" by some
The earliest design is the D'Arsonval galvanometer. It uses magnetic deflection, where current passing through a coil causes the coil to move in a magnetic field The voltage drop across the coil is kept to a minimum to minimize resistance in any
 circuit into which the meter is inserted

## Basic Principles of Electricity

## Measuring Devices - Ammeter

## Ampere - Volt - Ohm (AVO)Meter

An ammeter is always series connected in the circuit measured

Battery

Lamp

## (1) <br> Basic Principles of Electricity

## Measuring Devices - Ammeter

An ammeter is always series connected in the circuit measured

## Basic Principles of Electricity

## Ideal Ammeter

## Definition

An ideal ammeter is the one with zero internal resistance (Short Circuit)

- An ideal ammeter behaves as a short circuit, i.e. $R_{\text {amp }} \cong 0$.
- An ideal ammeter has zero resistance so that the measured current is not influenced

No ammeter can ever be ideal, and hence all ammeters have some internal resistance

## Basic Principles of Electricity

## Ideal Ammeter

## An ammeter should not influence the current measured

$$
\begin{aligned}
& I=V_{s} /\left(R+R_{\text {amp }}\right) \\
& R_{\text {amp }} \cong 0
\end{aligned}
$$

Hence,

$$
I=V_{s} /\left(R+R_{\text {amp }}\right) \cong V_{s} / R
$$

EE 209 Fundamentals of Electrical and Electronics Engineering, Prof. Dr. O. SEVAIOĞLU, Page 110

## Basic Principles of Electricity

## Non-Ideal (Real) Ammeter

## Definition

No ammeter can ever be ideal, and hence all ammeters have some internal resistance

A real (non-ideal) ammeter has always an internal resistance in series

- A non ideal ammeter behaves as a series resistance with: $R_{\text {amp }} \neq 0$
- Hence the the measured current is influenced (reduced)

$$
\left.\begin{array}{l}
I_{\text {load }}=V_{s} /\left(R+R_{\text {amp }}\right) \\
I_{\text {load }}=V_{s} / R
\end{array}\right\} \rightarrow I_{\text {load }}<I_{\text {ideal }}
$$

## Basic Principles of Electricity

## Measuring Devices - Clamp Ammeter

## The Need for Clamp Ammeter

Sometimes the electrical service carried out by the circuit may be so vital that it can not be interrupted by breaking the line for a series connection of the ammeter

Ammeter shown on the RHS is a particular design for such circuits to measure current flowing in the circuit as well as resistance without braeaking the circuit

## Basic Principles of Electricity

## Measuring Devices - Voltmeter

A voltmeter has a high internal resistance so that it passes only a small current
An ideal voltmeter has a very large resistance so that the the circuit in which it has been placed is not disturbed
An ideal voltmeter is an open circuit
However, no voltmeter can ever be ideal, and therefore all voltmeters draw some small current

Voltmeter is always parallel connected to the terminals measured

## ( <br> Basic Principles of Electricity

## Measuring Devices - Voltmeter

A voltmeter has a high internal resistance so that it passes only a small current

A voltmeter is always shunt (parallel) connected in the circuit that it measures

Measured voltage;

$$
\begin{array}{lc}
V_{0}=V_{s} & R_{L} \\
& --R_{1}+R_{L}
\end{array}
$$

## Basic Principles of Electricity

## Ideal Voltmeter

## Definition

An ideal voltmeter is the one with infinite internal resistance (Open circuit)

An ideal voltmeter has a very large resistance, $R_{m} \cong \infty$. i.e. it behaves as an open circuit, so that the the measured circuit is not influenced However, no voltmeter can ever be ideal,
 and therefore all voltmeters draw some current
A real voltmeter has a certain internal resistance so that it passes a certain current

## ( <br> Basic Principles of Electricity

## Ideal Voltmeter

No voltmeter can ever be ideal, and therefore all voltmeters draw some current.

$$
\begin{aligned}
& R_{m} \cong \infty \quad \text { i.e. } \quad R_{m} \gg R_{L} \\
& I_{m} \ll I_{\text {Load }} \\
& I_{\text {Source }}=I_{\text {Load }}+I_{m} \cong I_{\text {Load }} \\
& \begin{aligned}
V_{0} & =R_{L}\left(I_{\text {source }}-I_{m}\right) \\
& =R_{L} I_{\text {Source }}-R_{L} I_{m} \\
& \cong R_{L} I_{\text {Source }}
\end{aligned} \underbrace{}
\end{aligned}
$$

## Negligible

## Basic Principles of Electricity

## Example

## Problem

## Ideal Voltmeter

$$
I_{m} \cong 0
$$

Calculate the internal admittance $\mathrm{g}_{\mathrm{m}}$ of a voltmeter, if it reads 11.81 Volts when connected to a 0.48 mA current source with an internal admittance of $\mathrm{g}_{\mathrm{s}}=4 \times 10^{-5}$ Siemens

$$
\text { Siemens }=1 / \Omega
$$

## Basic Principles of Electricity

## Example

## Problem

Ideal Voltmeter

$$
I_{\mathrm{m}} \cong 0
$$

$R_{s}=1 / g_{s}=1 /\left(4 \times 10^{-5}\right)$ Siemens

$$
=10^{5} / 4=25 \mathrm{k} \Omega
$$

$I_{s} \times R_{\text {eq }}=V_{\text {read }}=11.81$ Volts Hence,

$$
\begin{aligned}
R_{\text {eq }}=V_{\text {read }} / I_{s} & =11.81 /\left(0.48 \times 10^{-3}\right) \\
& =24607.17 \Omega
\end{aligned}
$$

$R_{\text {eq }}=R_{s} / / R_{m}$
Hence,

$$
R_{\mathrm{eq}}=\left(R_{\mathrm{s}} \times R_{m}\right) /\left(R_{\mathrm{s}}+R_{m}\right)=24607.17 \Omega
$$

$$
R m=155.39 \mathrm{M} \Omega
$$

## Basic Principles of Electricity

## Wheatstone Bridge

The Wheatstone Bridge is an electrical circuit used to determine an unknown resistance $R_{x}$ by adjusting the values of known resistances, so that the current measured in the line connecting the terminals C and D is zero

## ( <br> Basic Principles of Electricity

## Wheatstone Bridge

## Principle

Adjust the resistances $\mathbf{R}_{1}, \mathbf{R}_{\mathbf{2}}$ and $R_{b}$ such that the ammeter connected between the terminals C and D reads zero current

Hence, the voltage difference between the terminals $C$ and $D$ is zero

$$
\begin{gathered}
\Delta V_{C D}=0 \\
\text { or } \\
V_{C}=V_{D}
\end{gathered}
$$

## Basic Principles of Electricity

## Wheatstone Bridge

## Principle

$V_{c}=V_{D}$
$V_{c}=V_{s} R_{b} /\left(R_{x}+R_{b}\right)$
$V_{D}=V_{s} R_{2} /\left(R_{1}+R_{2}\right)$
$V_{s} R_{b} /\left(R_{\mathrm{x}}+R_{b}\right)=V_{s} R_{2} /\left(R_{1}+R_{2}\right)$
or
$R_{b} /\left(R_{x}+R_{b}\right)=R_{2} /\left(R_{1}+R_{2}\right)$
$R_{b}\left(R_{1}+R_{2}\right)=R_{2}\left(R_{x}+R_{b}\right)$
$R_{b} R_{1}+R_{b} \cdot R_{2}^{\prime}=R_{2} R_{x}+R_{a} \cdot R_{b}^{\prime \prime}$
Or

$$
R_{x}=R_{b} \times R_{1} / R_{2}
$$

## ( <br> Basic Principles of Electricity

## Wheatstone Bridge

## Basic Rule

## Cross multiplication branch resistances must be equal at balance condition

$$
R_{x} \times R_{2}=R_{b} \times R_{1}
$$

Please note that voltage $V_{s}$. is neither used, nor needed in the above equation, i.e. its value is arbitrary

## ( <br> Basic Principles of Electricity

## Wheatstone Bridge

## Example

Calculate the value of unknown resistance $R_{x}$ in the balanced Wheatstone Bridge shown on the RHS

Cross multiplication of branch resistances must be equal at balance condition:

$$
\begin{aligned}
R_{x} & \times R_{2}=R_{b} \times R_{1} \\
R_{x} & =R_{b} \times R_{1} / R_{2} \\
& =100 \times 100 / 20=5000 \mathrm{hm}
\end{aligned}
$$
